## 2021 Outlook Theme #2: Dry Powder Versus Powder Keg

Benjamin B. Wallace, CFA - Portfolio Manager, Research Director

One of the unusual aspects of the 2020 recession is that it was caused by the inability of actors in the economy (consumers, businesses) to engage in activity, as it was blocked in order to prevent a healthcare crisis. Combining this with the large stimulus pushing money into bank accounts, there is considerable pent up energy in the economy.

The following chart shows year over year GDP growth and Excess Savings. Excess savings is savings (Personal Income – Personal Spending), minus the 5 year average savings rate, divided by total GDP. The chart clearly highlights two unusual features of the Covid-19 recession. First, year over year GDP dropped substantially, by 9%. This is twice the 2008-2009 Global Financial Crisis decline. Second, thanks to a combination of the CARES Act stimulus and restrictions on spending, savings exploded to a record high of 18.7% of GDP versus prior peaks of 2-3%. It was not only a record, but was more

than six times the prior record. This matters because saved income does not get spent, and thus does not appear in GDP. It does, however, represent future POTENTIAL spending. Some of this has ended up in the capital markets and added to the Fed induced bubble. But much of this is dry powder that consumers will put to work when certain economic activity becomes possible again. In a normal recession, consumers spend less because their income does not allow them to. In this case, consumers did not spend because they were not allowed to. Further illustrating the unusual nature of this economic cycle, Q2'20 was the first time ever Disposable Income (Personal Income minus taxes) was greater than total GDP, at \$18.4 versus \$17.3 trillion, as not only did consumers have more money than they could spend, but more money than the entire economy could spend. Similarly, according to Bloomberg, Allianz SE calculated Europeans have €500b of savings that were not spent on restaurants, travel, and other leisure activities. If just 25% of this amount were spent in 2021, it would be a 1% boost to the region's GDP.

Another sign of cash on the sidelines is, literally, cash. The combination of Excess Savings from the Fiscal Stimulus and the \$3 trillion surge in bond purchases from the Fed's reinvigorated QE program has caused cash levels to rise. M1 is the most easily accessible cash in the economy: currency, demand deposits, and other checkable accounts. As shown by the chart to the left, from the St. Louis Fed's research website, the stored cash in the economy in 2020 has surged by nearly \$3 trillion, from \$4 trillion to just under \$7 trillion. This is equal to the \$3 trillion rise in the 10 years from 2009 to 2019, when the Fed commenced its QE program. The limitations on economic activity have caused the Fed's liquidity injection to flow cash.

This surge has two implications, one positive and one negative. The positive is that it's another sign of the dry powder available for economic activity in 2021, once it is allowed to fully resume. The negative is that it's an indicator of how the 2020 surge in savings has flowed into assets, leaking out from cash into demand for other financial assets and contributing to 2020 being another year of "everything rallies" despite the massive disruption. Combining the two, 2021 should see the economic benefit of this cash being put to work. But with that recovery, the focus will eventually turn to how long the Fed will keep up its \$120b per month pace of QE purchases.

The other notable feature is that in both '00-'02 and '07-'09, the slowdown in GDP growth lasted 7 or 8 quarters. Given

the speed of this cycle, as well as the aforementioned excess savings, one would expect this cycle to last no more than 4 quarters. Thus, like all other parts of this period, the speed will be record breaking.

As just discussed, there is considerable stored up energy. This sets the table for delayed / deferred / denied economic activity to return as 2021 progresses and live up to the already optimistic market. Capacity may still be limited and/or inadequate to meet a surge in demand for some services or products. Paired with excess savings from fiscal stimulus and the monetary policy boost in asset prices, could this spur demand to exceed supply and cause inflation? This will take on more of the Fed's, and market participants', focus. Keeping your powder dry is in reference to gun powder, a chemical combination noted for its ability to both store considerable energy and to release it quickly. The question for 2021, is if the pent up energy in the economy can be released in a controlled, productive manner, or if it will cause a potentially damaging explosion. Will it function as *Dry Powder* or a *Powder Keg*? The outcome will determine the nature of the recovery.
