2022 Outlook Theme #1: Is the Risk of Inflation Overblown?

Benjamin B. Wallace, CFA - Portfolio Manager, Research Director

Inflation and unemployment are two of the most prominent economic data points. The Fed's dual mandate of price stability and maximum employment results in a focus on unemployment and inflation data, both to measure the economy, as well as to predict the Fed's policy movements. For the markets and the public, the two conjure up black and white stock photos of either men in fedoras standing in soup lines (Depression era unemployment) or long lines of cars at gas stations (1970's era inflation). The challenge is that both data points are backward looking and analyzing them on a month-to-month basis is difficult even in a normal economy.

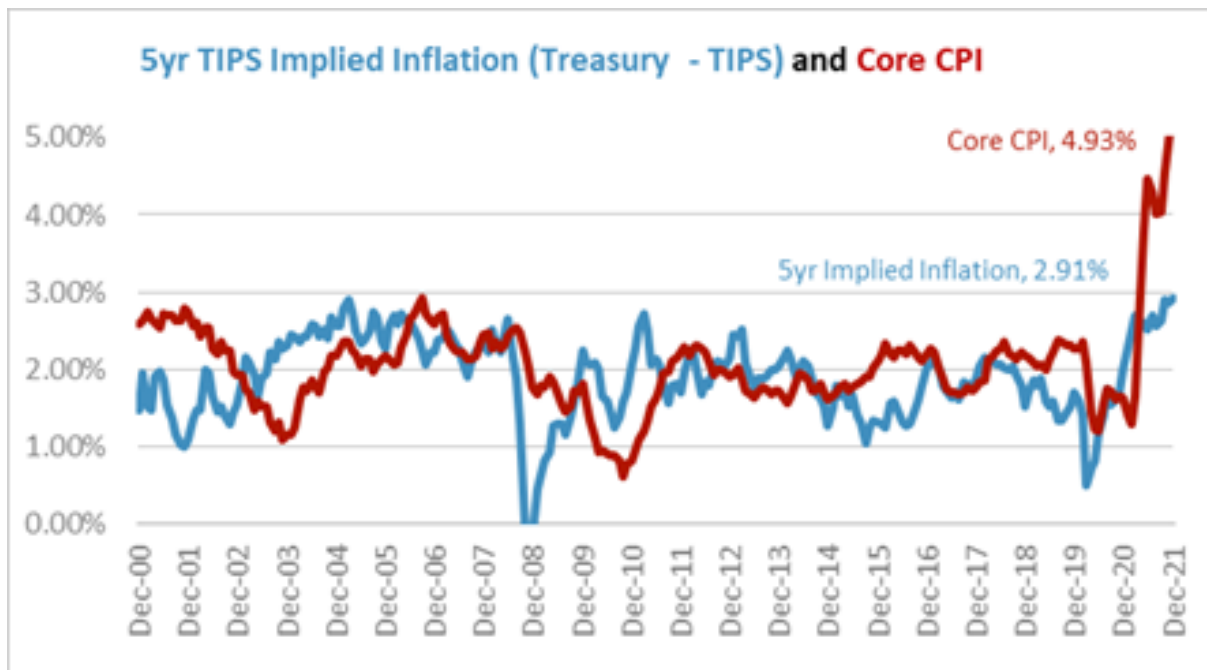

For 2020 and most of 2021, the primary economic data point was unemployment. First to assess the damage of lockdowns and then as a measure of the pace of recovery. As 2021 has progressed, inflation has taken on increased focus by the markets. The 2021 inflation surge is not up for debate, nor was it a surprise. Inflation collapsed in 2020. In 2021, the ongoing recovery caused unprecedented stress and strain on resources as Covid limited production and snarled supply chains, while demand, spurred by fiscal support and pent-up recovery spending, remained high.

Consequently inflation, like most every other market and economic data point, has been behaving in previously unheard of ways. Prior to 2020, we had never seen unemployment jump from 4% to 18% and back to 4% in just over a year. 2020 also saw the stock market go from all-time highs, into a bear market, then fully recover in less than 6 months (as it did from February 2020 to August 2020), completing the cycle in a fraction of prior recoveries. Oil futures had never traded below \$0 (as they did in April 2020), only to recover their pre-pandemic price level of \$55/bbl within a year. Across an array of economic and market data series, the key trend has been consistent: indicators reached rarely (or never) seen levels, followed by an unprecedented speed of recovery. In all these cases, the disruption was driven by Covid, and the impact eventually passed.

This is key to the Fed's stated belief for most of 2021 that, like these other measures, the surge in inflation would be transitory, as the causes were rooted in the pandemic. As the spring jump in the CPI hung on through the rest of the year, this view came under scrutiny. Ultimately the Fed abandoned the term "transitory", though it was more due to a

misunderstanding: to the Fed transitory meant the factors causing it would pass, while for the market it meant it would be gone quickly. Two issues allowed inflation to hang around. First, the emergence of the Delta variant extended the ongoing supply chain disruptions, particularly in Asia, where yet to be vaccinated countries had to return to lockdowns at points over the summer. The disruption was temporary, but enough to keep the supply of certain goods restricted for a few more months. Second, while the period of low inflation started in March 2020, it lasted all the way until February of 2021. Even though it would be reasonable to expect a transitory bump in year-over-year CPI to last for twelve months, the market seemed to lose patience in only three.

Despite these doubts, there is ample evidence the year-over-year jump in inflation has Covid specific causes. Looking at the 6.8% November CPI, the largest impact was from a 33% increase in energy, driven by oil doubling from \$40 to \$80/bbl over the prior year, as the re-opening recovery has spurred demand for fuel. For a similar impact to be felt in 2022, oil would have to double AGAIN, to \$160/bbl. This is stripped out of the core CPI rate, lowering it to 4.9%. But still included in that core rate is the impact of a record 11% rise in new car prices and a 33% jump in used car prices. Both of these increases are unprecedented, a result of one of the most Covid disrupted supply chains, where a lack of semiconductors led to near empty dealer lots during the year and still low inventories as the year ends. Together, the two auto categories added 1.3% to the headline rate, even though they account for only 7% of the CPI index. Not only will the auto impact fade, but as chip production recovers and output resumes, its likely auto prices will be reducing, not increasing, CPI by the end of 2022.

The market understands this, which is why implied inflation, based on 5yr TIPS breakeven rates, is only 2.9%. While still above the Fed's 2% to 2.5% target, it's not nearly as dire as the core CPI (4.9%) or headline (6.9%) would suggest.

Ironically, this is why unemployment becomes the important inflation statistic to watch.

When supply and demand are out of balance, the tool to fix that is price. For labor, the price is wages. Until the unemployment rate fell below 4% in 2018, most of the post financial crisis period had slow wage growth, which was key to low inflation during that period. Since the start of the pandemic, wage data has gone haywire (rising as high as 8% in April 2020 and dropping close to 0% in April 2021). While the current 4.8% year-over-year rate is high, it will be in focus for 2022 to see if it starts to return to normal.

The challenge for the economy in 2022 will be the tight labor market. The chart to the left shows the unemployment rate and the job openings rate. The openings rate (6.8%) exceeds the unemployment rate (4.2%) by 2.6%, more than three times the prior peak of 0.8% in 2018. For multiple reasons, the labor market has been disrupted and supply limited.

Inflation concerns are front and center for the Fed, the public, and thus the markets. While inflation is certainly a risk, there are also reasons to think inflation will slow as 2022 progress. With so many economic and market data points seeing large, but passing, impacts, it is reasonable to think inflation will follow the same course as supply chain issues are addressed. However, if the labor markets remain tight through 2022, that could keep pressure on wages and provide a tailwind to inflation. As the year starts, the market will be closely following the data to determine *Is the Risk Inflation Overblown?*
