6/30/22 Focal Point: Hard Landing Versus a Soft Landing

Benjamin B. Wallace, CFA - Portfolio Manager, Research Director

The decline in prices across asset classes is obvious. The question now is, what is the market decline reflecting? During Q2, even though it was inflation picking up, market movements showed a shift in focus, from inflation to the risk of a recession. The Fed rate hikes have clearly impacted valuation. The market frames this debate as whether the economy will have a hard landing or a soft landing. A hard landing is a true recession, and there have been two since 2000: The 2001/2002 dotcom and telecom crash and the 2008 GFC. GDP growth was negative, unemployment rose, and manufacturing surveys dropped significantly. There have also been more modest slowdowns, when GDP slowed and manufacturing surveys showed weakness. In the labor market, payroll growth slowed below trend, but did not drop. These included 2003 / 2004 (Iraq invasion), 2012 (European debt crisis), 2015 to 2016 (oil price collapse, China slowdown), 2019 (China trade war).

Looking at equities, the '22 (and especially Q2'22) pullback has been driven by compressing PE multiples. For example, the S&P 500 has declined 20% ytd, with a 26% decline in its PE multiple, since earnings have continued higher thus far. The effect is more pronounced in the S&P Growth Index, where a 28% price decline is due to a 32% decline in the PE multiple. And even S&P Value, which has held up better with an 11% price decline, has seen its multiple fall by 19%. The positive is that the S&P 500 and its two component indices have declined to their 20 year average multiples, compared to the start of the year when they were 30%, or more, above this level. And as the Growth / Value disparity shows, a large amount of the multiple compression in the S&P 500 came in the higher PE Growth stocks. It's also a positive that since the PE multiple is falling more than the price, this means earnings are still rising.

	Ytd Return	Ytd PE Ch	Q2'22 PE	Q4'21 PE	Avg PE	Q2'22 v Avg	Q4'21 v Avg
S&P 500	-20.0%	-25.8%	15.9	21.5	15.9	-0.1%	34.7%
S&P Growth	-27.6%	-31.7%	19.1	27.9	18.3	4.5%	52.9%
S&P Value	-11.4%	-19.3%	13.6	16.9	13.2	3.3%	28.0%

The market is worried that if the decline thus far is simply compressed valuation, then what would be the implication of a recession causing a decline in earnings? The 2002 dotcom / telecom crash saw S&P 500 eps decline 10%. The 2008 GFC saw eps decline 15%. On the other hand, 2003, 2012, 2016, and 2019 saw eps growth slow to near 0%, but did not go negative.

As of today, the S&P 500 is still expected to see eps grow by 10% (from \$216 to \$237). Assuming the modest drag of a soft landing pushes that towards zero, the combination of flat eps and an average PE (as of today) would suggest that equities mostly reflect a soft landing scenario. But there could still be some risk to the downside should earnings decline.

Turning to Fixed Income, where prices move in the opposite direction of interest rates, the focus in 2022 has mostly been on how rising rates have caused prices to fall. The corollary, though, is that lower prices have created higher yields. The table below shows the year to date returns on the Barclays Aggregate, Merrill Lynch Investment Grade, and Merrill Lynch HiYield indices. It also shows the yields at the start of the year, the end of Q2, and the change. For all three, the yield has nearly doubled. Just as with the case of stocks and PE ratios, the price decline is unpleasant, but the silver lining is improved valuation.

	Ytd Return	Ytd Yield Ch	Q2'22 Yield	Q4'21 Yield	Avg Sprd	Q2'22 Sprd	Q4'21 Sprd
Agg	-10.3%	1.96%	3.72%	1.76%	0.33%	0.74%	0.25%
ML Igrade	-13.9%	2.31%	4.72%	2.40%	1.10%	1.74%	0.89%
ML HiYield	-14.0%	4.05%	8.95%	4.90%	4.60%	5.98%	3.39%

The pullback in credit sensitive parts of fixed income shows a shift from inflation to recession during Q2. Helpfully, for bonds there is an added tool for assessing credit risk: spreads. In addition to seeing yields rise due to rising treasury yields, they have also moved up as the excess yield offered to investors, or spread, has risen. All three of the indices listed have seen spreads move from below, to above, average. In prior soft landing periods, such as 2012 or 2016, HiYield peaked out at around 700 bps spread, while Igrade peaked at around 200 bps. However, in periods of deep stress, like 2020 pandemic or the 2002 telecom crash, spreads peaked at higher levels (1000 bps for HiYield, 250-300 bps for Igrade). Comparing current spreads to these levels, they are already close to the modest pullback levels. But they could fall further in the “severe” scenarios. Much like stocks, credit spreads are fairly close to pricing a “soft landing” but could see some added downside in a “hard landing” scenario.

The challenge for credit is that every cycle is different and each one peaks out at a different level. Right now, we are in the period of rising spreads. The good news is they are above average and thus provide investors with better compensation than the start of the year. Until they peak and start to come down, though, some caution is warranted. While finding the peak is harder to gauge, the compensation today is certainly better than when the year began.

Looking at markets overall, valuation has compressed as the Fed has raised rates. Without question, investors are being

offered better compensation than when the year began. The question is whether the economy will see a soft landing or a hard landing.

The arguments for a soft landing are based on the economy still being on sound footing. Unemployment remains historically low and payroll growth remains robust. Manufacturing surveys, while down from Covid reopening highs, are still solidly in expansion territory. The primary issue remains supply chains are facing shortages, not an over investment in a certain sector of the economy. The recent post covid recovery is only a year old, and that is a short amount of time to build serious imbalances in the economy. We have long noted the primary impact of QE was on prices, not the economy. So pulling back on QE, by shifting to QT, could also mostly show up in prices. This process is certainly underway. More speculative areas, ranging from the S&P 500 Growth to disruptive “ARK stocks” to crypto currencies, have crashed much harder than the main markets, as they were more overpriced amidst the QE bubble. In other words, a soft landing would be focused on a valuation-based correction to financial markets.

A hard landing could occur if the Fed is forced to continue raising rates to stave off inflation, even if there are signs the economy is weakening. Or a variant of this, which is the Fed, in an effort to prove it is fighting inflation, responds to high inflation in the short term with continued rate hikes, even though its well known that there is a lag between policy change and the economy responding. In either case, the risk is the quick increase in rates by the Fed wind up slowing the economy too much in six to nine months, creating a recession.

This is why the market is looking for a sign the Fed can take its foot off the rate hike “brake”. It does not need to cut rates (or even stop raising them), just signal that it’s starting to move back towards normal. The market decline thus far reflects the impact of higher rates on valuations across asset classes. The question is if the market will also have to adjust to notably weaker fundamentals. The longer the Fed tightens, the more likely it is to get a *Hard Landing versus a Soft Landing*.
