9/30/21 Focal Point: Transitory Taper Turbulence

Benjamin B. Wallace, CFA - Portfolio Manager, Research Director

If “unprecedented” was the most used word for financial markets in 2020, “taper” is in the running for most used in 2021. Its closest competitor is “transitory”. Combining the two, as the Fed plans its policy shift to slow the pace of QE purchases, the Focal Point is if we will get Transitory Taper Turbulence, meaning some volatility as the policy shift is digested, but that will pass.

On 6/30, the Focal Point asked if a *Taper Tsunami was on the Horizon*. Could 2021 look like 2013, when the 10yr yield declined, only to set up for a reversal that exaggerated the “taper tantrum” (the nickname for the 100bps jump, from 1.67% on 4/26/13 to 2.74% on 7/5/13)?

In Q3’21, despite the steady drumbeat of taper talk, rates drifted lower for much of the quarter. Starting at 1.47%, the 10yr dropped 30 bps, to 1.17%. The low was reached on 8/3, after the Fed’s 7/28 meeting (when it reiterated Quantitative Easing etc. and said talking about talking about the taper had started) and prior to July’s unemployment report on 8/6. It also coincided with travel and other industry warnings about the Delta driven surge weighing on the recovery.

When the Fed’s Jackson Hole event did not deliver a direct message, or market response, that the taper was forthcoming (even though most signs pointed to that), it seemed perhaps this time would be different. While rates drifted slightly higher, they traded in a tight 1.30-1.37% range until the Fed’s 9/22 meeting, when they made the well-telegraphed move that the taper was likely to start at the upcoming November meeting. At which point, the 10yr yield rocketed 20 bps in 1 week, from 9/22 to 9/29. At the same time, Growth over Value reversed, with Value significantly outpacing Growth into the quarter end.

In other words, the “Taper Tsunami” of the market allowing rates to drift lower just before the Fed starts to taper, and thus exacerbating the move, appears to have returned, merely arriving one event later than expected. It joins the list of Delta delayed 2021 events. But, as noted, Delta has not changed much, and starting the taper still looks like a 2021 event.

Average Periods	Rolling 12m S&P		Rolling 3m S&P	
	QE	No QE	QE	No QE
	17%	9%	4.2%	1.9%
	78	54	78	54

With the QE taper now explicitly on the table, the markets will have to start thinking about an environment without the tailwind of QE on asset prices. Since QE was first introduced in 2009, market performance has been better in periods with QE than without.

To highlight the impact of QE on stock returns, the chart shows S&P rolling 12 month returns in periods when the Fed has grown its balance sheet over the prior 12 months, and the rolling 3 month S&P returns during periods of QE of 4.2%, doubling the 1.9% return in periods with no QE. Annually, its 17% versus 9%.

Beyond the averages, the risk to the markets is shown anecdotally, as well. The two most notable periods of market weakness, late 2015/early 2016 and late 2018/early 2019 coincided with QE policy shifts. 2015-2016 was due to the Fed tapering its QE purchase pace to zero. 2018-2019 was the one period when the Fed allowed the balance sheet to decline, by letting holdings to mature without being reinvested. While the excess demand of QE starts in the bond market, it certainly appears to spread to other asset classes as well.

Shifts in QE can also affect volatility. After an all-time record high in April 2020, trailing 1-month average daily volatility fell from 5% to as low as 0.3% during Q3'21. However, in the final weeks, it rose back to 0.6%, as taper concerns built.

Mind you, the “no QE” return periods, with an average 12 month return of 9%, are still in line with historic returns. So, a big part of the “no QE” market adjustment is for investors to expect a risk/return trade off that is average. Volatility could be higher, returns could be lower.

Entering Q4'21, the question is if this move in the final two weeks of Q3'21 is the extent of the '21 taper tantrum, or the start of something more? The argument for “that’s it” relies on the well-telegraphed nature of the Fed’s pending QE program, but the move was also well-telegraphed before the Fed’s 9/22 meeting, yet the market seemed suddenly taken aback.

While there have been other headline events (debt ceiling and infrastructure bills in DC, rising energy/commodity price causing inflation discussions, China’s Evergrande real estate problem, Delta variant), the big shift in rates came after the Fed’s announcement.

Whether the interest rate adjustment is quick or unfolds over time, a recovering economy (including the recent surge in inflation, even if some of it is transitory), would suggest rates should be higher. From a simple supply and demand standpoint, the market losing a \$120b per month buyer of Treasuries should, in some way, register as a decline in price (and increase in rates). Thus, it’s possible more turbulence could arise. After all, it’s been a pretty smooth market increase for most of 2021. That is why Q4'21 could experience *Transitory Taper Turbulence*. Should the ride start to get bumpy, the role of the calming pilot over the intercom will fall on Federal Reserve Chairman Powell to remind the markets that a few bumps are to be expected.
