Outlook Theme #1: Recurring Transitory Issues

Benjamin B. Wallace, CFA - Chief Market Strategist

Economic data was highly disrupted in 2020 and 2021 due to the Covid pandemic and the resulting healthcare policies. Heading into 2022, we noted in *Is the Risk of Inflation Overblown?* that the market's focus was shifting from the recovery in unemployment to inflation, as the focus went from "can the economy recover?" to "has the economy recovered too quickly?"

Because of this, the Fed had put inflation front and center. The debate was how soon the Covid pressures would fade, summed up in the Fed's use of the word "transitory." Unfortunately, geopolitical events have again interjected themselves, and a new variable needs to be considered: the Russian invasion of Ukraine.

The impact of this event, the largest military action in Europe since World War 2, are significant, ranging from the balance of power in Europe to the humanitarian crisis it has created. Financial markets quickly focused on where supply and demand would be most disrupted: the price of oil. Due to a combination of outright sanctions on oil purchases by some countries, as well as the impact of sanctions on other parts of the oil supply process (bank payments, foreign exchange, insurance, refiner's ability to take delivery, oil tanker contracts), Russia's 10% of global oil production suddenly become limited (though not outright eliminated).

Rising oil prices were already exhibiting some inflation pressure, thanks to re-opening economies spurring a resurgence in demand that was outstripping slower-to-recover supply. This trend was exacerbated by the Russian invasion of Ukraine. The chart to the left illustrates how financial markets have seen yet another “unprecedented” event, due to the sudden disruption to Russian oil supplies. The dark line represents the current price of oil, while the light blue line reflects the price of oil futures two years out. Typically, the current price of oil trades at a slight premium to the future price, which is known as “backwardation”. On the chart, this is reflected by the red line. Most of the time, backwardation is between \$0 and \$5 per barrel. But as the chart shows, in addition to oil surging during Q1’22, backwardation jumped to a record \$33 per barrel on March 8. This is because oil traders, suddenly unable to buy Russian oil, had to rush to buy oil for immediate delivery to fill contract needs. Amidst their scramble, short term prices spiked. However, the record backwardation does offer some insight. The market thinks the current disruption, and price spike, is temporary, and the current price should normalize toward the forward price. In fact, from March 8 through the end of the quarter on March 31, the current price of oil fell from \$124/bbl to \$100/bbl, while the two year forward price only declined from \$90 to \$85 (and thus backwardation went from \$33 to \$15/bbl).

The interpretation is that Russia’s invasion of Ukraine is certainly highly disruptive to the price of oil, but the markets are still trying to find a new equilibrium. Until backwardation returns to normal levels, the current price of oil should not be considered a reliable measure of where oil will be in a few months.

Other commodities were disrupted, as well. Nickel is a Russian export disrupted by trade sanctions, and it surged 57%. Ukraine is a major wheat producer, and with obvious risks to its 2022 harvest, prices rose 30%. The former will impact industrial supply chains, while the latter highlights risk to the global food supply. Neither is crippling, but both are added stress on a global system already under duress.

And this was not the only disruption. While Ukraine rightly was in the headlines, China’s ongoing pursuit of zero-Covid remained an equally disruptive force. During Q1’22, China locked down the city of Shenzhen, a major technology and manufacturing hub with a population of 17 million, for a week, disrupting both auto and memory chip supply chains. And

as the quarter ended, it was in the process of locking down Shanghai, considered the economic capital of the country. While the rest of the world moved through the Omicron wave with polices of booster shots, masking, and a few restrictions on public gatherings, China is shutting a city of 26 million over about 10,000 cases per day, of which only a few hundred are symptomatic. The point is not to debate the policy decision. It is to point out that supply chains, though improving, are still seeing Covid disruptions.

All of which brings the focus back to inflation and, more importantly, inflation expectations. Core CPI has continued higher, though within the details of the report there have been signs of the Covid pressures peaking. Categories such as new and used cars, furniture, and apparel have lately seen price spikes ease, an example of the transitory inflation pressures fading. Unfortunately, the notable shift is the TIPS 5yr implied inflation breaking above 3%. As TIPS tracks headline inflation (which unlike core, includes food and energy), part of this is simply pricing the oil and food price spike that will roll through CPI in the next few months. But it also shows how the market is raising its inflation expectations again, as multiple rounds of transitory pressures can start to feel permanent.

The hope for 2022 was that the disruptions to commodity prices and supply chains from the pandemic and the subsequent re-opening would fade, as economies continued to return to normal. Unfortunately, Russia's invasion of Ukraine and China's continued pursuit of zero-Covid polices have allowed both of these factors to linger. For Fed policy (and market participants trying to forecast Fed policy), this comes at an awkward time. Just as the Fed is trying to gauge how much of the current inflation surge is from transitory pandemic related factors, another set of outside forces have merged to muddy the waters. This is the challenge of dealing with *Recurring Transitory Issues*.
