Tax Fundamentals: Why Similar Income Can Produce Different Tax Results

Todd A. Herman, CFP® - Financial Advisor | Financial Planning Specialist

In prior installments of our Tax Fundamentals series, we considered topics including:

- How income flows through the tax system
- How deductions and credits adjust the result
- Why refunds and balances due can differ from expectations

These naturally raise a broader question: If the tax structure is consistent, why can tax outcomes vary so much from one year to the next?

That question came up recently with a client whose income was similar across consecutive years, but whose tax results looked noticeably different.

“My income didn’t really change,” she said, “so why does this look so different?”

The answer was not that the system had changed. It was that income timing and account activity had changed. The core issue is that tax outcomes are not driven by income alone; they are shaped by when income is recognized, where assets are held, and whether those decisions affect thresholds elsewhere on the return.

This discussion is most relevant for individuals who are beginning to manage their own finances or seeking to understand which planning levers can influence tax outcomes beyond the calculation itself.

TIMING: WHEN INCOME OCCURS DURING THE YEAR MATTERS

The tax system operates on an annual calendar, but financial life does not always align neatly with that structure.

Income received in December is generally taxed in that year. Income received in January is generally taxed in the next.

The same applies to certain deductions, credits, investment gains, retirement contributions, and charitable gifts. The underlying income may be similar, but the year in which it occurs can influence the result.

This is one of the simplest explanations for why similar income levels can produce different outcomes. A bonus, investment sale, Roth conversion, or business payment may shift between years and change how the broader calculation applies.

In many cases, the difference is not simply the tax rate applied, but whether income crosses thresholds that change how other parts of the return are calculated.

From a planning perspective, timing is less about predicting every future variable and more about recognizing that the same income may carry different tax implications depending on when it occurs.

ACCOUNT TYPE: WHERE ASSETS ARE HELD

Account type is another major driver of tax outcomes (refer to our [2026 AGI/MAGI Summary Guide](#)). Traditional retirement accounts generally provide tax deferral. Contributions may reduce taxable income today, but future withdrawals are typically taxable. Roth accounts work differently, in that contributions are made with after-tax dollars, and qualified withdrawals may be tax-free. Health Savings Accounts add another layer, offering tax benefits tied to eligibility and qualified medical expenses.

For example, income generated in a taxable account may appear on the current year's return, while the same activity inside a retirement account may not be taxed until funds are distributed. Over time, those differences can influence taxable income, Adjusted Gross Income, Medicare premium thresholds, credit eligibility, and future withdrawal planning.

As Grimes & Company advisor [Patty Lavoie, CFP®, CPA](#), notes: "The account wrapper often matters as much as the investment itself. A dollar in a traditional IRA, a Roth IRA, an HSA, and a taxable account may all look the same on a statement, but they do not move through the tax system the same way."

Viewed comparatively, traditional accounts often provide current-year tax relief but create future taxable income, while Roth accounts may reduce future tax exposure without offering a current deduction. HSAs can be especially tax-efficient, but only when eligibility and usage requirements are satisfied.

None of these structures is inherently better. Each reflects a different tradeoff between current taxes, future flexibility, and long-term planning.

HOW TIMING AND ACCOUNTS INTERACT

The interaction between timing and account structure is where tax outcomes begin to diverge more meaningfully.

A retirement contribution may reduce current taxable income, while a Roth conversion may increase it in exchange for potential future tax-free treatment. A realized capital gain may affect not only the tax on that gain, but also whether income crosses thresholds tied to other parts of the return.

This is where differences become less intuitive. Two individuals with similar income may experience different results

because one recognizes income in a taxable account while another defers it within a retirement account. The same individual may also see different outcomes from year to year as the timing of income and deductions shifts.

In many cases, the impact is not limited to the transaction itself. Changes in income can influence Adjusted Gross Income (AGI) or Modified Adjusted Gross Income (MAGI), which may affect credit eligibility, deduction limits, Medicare-related thresholds, and other income-based calculations.

Viewed comparatively, tax brackets often receive the most attention. In practice, timing and account structure frequently determine not only how much income reaches those brackets, but whether that income triggers additional effects elsewhere in the tax calculation.

PLANNING IMPLICATIONS: FOCUS ON THE LEVERS, NOT JUST THE OUTCOME

The tax framework itself is consistent (refer to our [2026 Important Numbers Guide](#)). Income is measured by year, account types determine how income is recognized, and deductions, credits, and thresholds apply based on the figures reported on the return.

What varies is how financial decisions align with that structure.

For the client sitting across the table, the difference between the two years became clearer once we looked beyond total income. The issue was not simply how much she earned. It was when income was received, where assets were held, and how those factors influenced the broader calculation.

From a planning perspective, this is where attention is often best directed. Not every tax rule can be controlled, and not every outcome can be predicted. But timing, account structure, and income recognition are among the few levers that can be evaluated deliberately.

Taxes should not drive every financial decision. They are one factor within a broader plan that includes cash flow, investment objectives, retirement security, liquidity, and family priorities. As those elements evolve, a disciplined approach means monitoring these levers carefully, avoiding reactionary decisions, and keeping tax outcomes in the context of a long-term plan.

IMPORTANT DISCLOSURES:

Please remember that past performance is no guarantee of future results. Different types of investments involve varying degrees of risk, and there can be no assurance that the future performance of any specific investment, investment strategy, or product (including the investments and/or investment strategies recommended or undertaken by Grimes & Company Wealth Management, LLC (d/b/a Grimes & Company), or any non-investment related content, made reference to directly or indirectly in this blog will be profitable, equal any corresponding indicated historical performance level(s), be suitable for your portfolio or individual situation, or prove successful.
