What Should Investors Do When Too Much Wealth Is Tied Up in One Stock?

For many investors, a concentrated stock position is a sign of success. It may come from years of company stock compensation, an early investment in a successful business, founder equity, inherited shares, or ownership in a family company. Over time, one stock can grow into a large share of an investor's overall wealth.

That success can create a planning challenge. Strong performance may build significant wealth, but having too much tied to one company can also increase risk. If that stock declines sharply, a large portion of the investor's portfolio and broader financial plan may be affected.

The question is usually not whether the company is good or bad. The better question is whether one position has become too large relative to the investor's overall goals, liquidity needs, and risk tolerance.

At some point, many investors face an important decision: should they sell shares and diversify, or could there be a better alternative?

WHY SELLING IS NOT ALWAYS SIMPLE

The most direct option is to sell shares and reinvest the proceeds into a more diversified portfolio.

Selling can be attractive because it gives the investor immediate liquidity and control. The investor can decide how much to sell, when to sell, and how to reinvest the proceeds. The new portfolio can then be built around income needs, risk tolerance, time horizon, tax considerations, and long-term financial goals.

Diversification can also reduce company-specific risk. If one stock has grown to represent a large portion of net worth, selling part or all of the position may help reduce the impact that any single company can have on the investor's financial future.

The problem? Taxes.

Many concentrated stock positions have large unrealized capital gains. Selling appreciated shares may create a

significant tax bill, especially for investors who have held the stock for many years.

For example, suppose an investor bought stock for $200,000 and the position later grew to $2 million. If they sell the full position, they may owe taxes on the $1.8 million gain. That potential tax cost can make investors hesitant to diversify, even if they understand the risk of holding too much of one stock.

Taxes are not the only factor. Emotional attachment can also play a role. An investor may feel loyal to a company they helped build, or they may worry that selling means missing out on future growth.

Those concerns are understandable. But they should be weighed against the risk of allowing one stock to drive too much of the investor's financial outcome.

A range of planning strategies can be tailored to address the tax and diversification challenges created by highly appreciated assets. One option that may be appropriate for certain investors is an exchange fund.

WHAT IS AN EXCHANGE FUND?

An exchange fund is designed to help eligible investors diversify a concentrated stock position without immediately selling the shares outright.

Rather than selling appreciated stock, investors contribute shares to a pooled investment vehicle. In return, they receive a proportional interest in a more diversified portfolio.

Using the earlier example, instead of selling a $2 million stock position and paying taxes immediately, the investor may contribute those shares into an exchange fund alongside other investors with similar concentrated positions. One investor may contribute Apple stock, another may contribute Tesla, and another may contribute Microsoft. Instead of owning only one company, each investor now has exposure to a broader mix of the contributed holdings.

The main potential benefit is tax deferral. Because the investor is contributing shares rather than selling them directly, capital gains taxes can be deferred until a later date.

For investors with highly appreciated stock, this can be appealing. It may allow them to reduce single-company exposure while keeping more capital invested over time.

However, an exchange fund does not eliminate the embedded tax issue. In many cases, it delays when the tax is recognized. The investor's basis, the fund's structure, the holding period, and the eventual exit all still matter.

WHERE THE TRADEOFFS ACTUALLY SIT

Exchange funds may offer benefits, but they are not for everyone, and the decision between selling concentrated stock and using an exchange fund usually isn't so straightforward.

Selling stock outright is generally simpler. The investor gets cash, pays any taxes due, and can reinvest the proceeds

based on their broader financial plan. This approach may be appropriate for investors who value control, need liquidity, or want a clear and immediate reduction in concentration risk.

The downside is the potential tax cost. If the position has a large unrealized gain, selling may reduce the amount available to reinvest after taxes.

An exchange fund may help address that concern by allowing the investor to diversify without immediately triggering the same tax result as an outright sale. For investors with large unrealized gains and a long time horizon, that tax deferral can be meaningful.

But exchange funds come with their own limitations.

One of the biggest tradeoffs is liquidity. Many exchange funds require investors to remain invested for a long period, often seven years or longer. During that time, access to the funds may be limited.

Exchange funds may also involve higher fees, more complex tax reporting, less control over investment decisions, minimum investment requirements, and eligibility standards. Investors also need to understand what they may receive when they eventually exit the fund and how that future exit may be taxed.

The tax treatment of exchange funds is complex and depends on the specific fund structure, holding period, contributed securities, and future redemption or sale. Investors should review these details with their tax and investment advisors before proceeding.

COMPARING THE TWO APPROACHES

Selling concentrated stock offers clarity and control. The investor knows what is being sold, what taxes may be due, and how the remaining proceeds can be reinvested. It may be the better fit when liquidity is important, when the investor wants full control over the portfolio, or when reducing concentration risk quickly is the priority.

An exchange fund may be more attractive when the investor has a large unrealized gain, does not need near-term liquidity, and is comfortable accepting restrictions in exchange for potential tax deferral. It may reduce exposure to a single stock, but it also limits flexibility and introduces additional complexity.

Neither approach is automatically better. Selling may be more expensive from a tax standpoint, but more flexible. An exchange fund may be more tax-efficient in the near term, but less flexible.

The right decision depends on the investor's full financial plan.

Key questions include:

- How much of total net worth is tied to this one stock?
- How large is the unrealized gain?
- How much liquidity is needed over the next several years?

- Is the investor comfortable giving up access to the assets for an extended period?
- How important is control over the investment portfolio?
- Would the tax cost of selling materially affect the long-term plan?
- Does the exchange fund's structure fit the investor's goals and risk tolerance?

These questions help move the conversation away from a simple "sell or hold" decision and toward a more thoughtful comparison of tax cost, diversification, liquidity, and control.

LOOKING AHEAD

Managing concentrated stock is not just an investment decision. It is a financial planning decision. Reducing risk matters, but so does maintaining flexibility, understanding tax consequences, and making choices that support the investor's broader goals.

Selling outright may be appropriate for investors who value liquidity, simplicity, and control, even if it creates a tax bill. An exchange fund may be worth considering for eligible investors with significant unrealized gains, longer time horizons, and the ability to accept limited liquidity.

As market values, tax rules, liquidity needs, and family goals evolve, concentrated stock decisions should be revisited with discipline rather than urgency. The objective is not simply to reduce one risk, but to manage concentration, taxes, flexibility, and long-term planning priorities in a coordinated way.
